LLM

An LLMChain is a simple chain that adds some functionality around language models. It is used widely throughout LangChain, including in other chains an...

Router

This notebook demonstrates how to use the RouterChain paradigm to create a chain that dynamically selects the next chain to use for a given input.

Sequential

The next step after calling a language model is make a series of calls to a language model. This is particularly useful when you want to take the output fro...

Transformation

This notebook showcases using a generic transformation chain.
