# Template formats

By default, `PromptTemplate` will treat the provided template as a Python f-string. You can specify other template format through `template_format` argument:

```
# Make sure jinja2 is installed before running this

jinja2_template = "Tell me a {{ adjective }} joke about {{ content }}"
prompt_template = PromptTemplate.from_template(template=jinja2_template, template_format="jinja2")

prompt_template.format(adjective="funny", content="chickens")
# -> Tell me a funny joke about chickens.
```

Currently, `PromptTemplate` only supports `jinja2` and `f-string` templating format. If there is any other templating format that you would like to use, feel free to open an issue in the [Github](#) page.
